Research Profile

PhD researcher in biomedical engineering working on AI for clinical neurophysiology and medical imaging. My doctoral research develops EEG-based screening, triage and decision-support tools for dementia and epilepsy, with an emphasis on interpretable signal features and testing on independent clinical cohorts. This includes first-author work on reduced-electrode EEG for cognitive screening, accepted at GlobalSouthAI @ NeurIPS 2026, and on patient-adaptive seizure detection, published in Computers in Biology and Medicine. I also build automated medical imaging pipelines and lightweight AI agents that run locally. As a co-founder of Hridae Medical Technologies, I work on wearable monitoring and ECG models for precision cardiology and neurology. I trained in physiology and neuroscience before moving into engineering.

Education

Indian Institute of Technology (BHU) Varanasi — *Varanasi, India*
PhD in Biomedical Engineering (CGPA: 9.6/10) — 07/2023 – Present
Thesis area: EEG-based screening, triage and clinical decision support.

University of Calcutta — *Kolkata, India*
M.Sc in Physiology (Neuroscience specialisation), First Class (CGPA: 7.4/10) — 09/2019 – 09/2021
Thesis: "Neuropsychophysiological Behaviour of Adenosine: Crosstalks between Neurotransmitters"

Surendranath College, University of Calcutta — *Kolkata, India*
B.Sc in Human Physiology (Honours) — 07/2016 – 06/2019

Positions

Co-Founder, Hridae Medical Technologies Pvt. Ltd. — *01/2026 – Present*
Wearable monitoring for precision cardiology and neurology: devices, ECG and other analysis models, and clinician review software, developed with clinicians.

Doctoral Researcher & Teaching Assistant, School of Biomedical Engineering, IIT (BHU) — *07/2023 – Present*
EEG-based screening and triage tools and clinical decision-support systems, with a focus on interpretability and testing on independent cohorts. In collaboration with the Department of Neurology, IMS BHU, and with AIIMS New Delhi, IIT Kanpur and IIT Kharagpur. Experimental design, data collection and analysis, algorithm development, scientific writing and teaching.

Featured Research

Low-channel EEG for cognitive triage *GlobalSouthAI @ NeurIPS 2026 • IIT (BHU), IMS BHU*

Studied how far a clinical EEG can be simplified for cognitive screening, using memory-clinic recordings re-derived to simulate low-channel devices and independent cohorts from other hospitals. A few well-placed electrodes screened about as well as the full clinical montage, and EEG added value beyond age alone; detecting mild cognitive impairment remains an open problem. Proposes a simplified recording design for prospective device studies.

Current Research

- **Low-channel EEG screening for dementia:** electrode placement, sampling and output design for cognitive triage devices, tested at hospitals not used in training.
- **Epilepsy monitoring and seizure forecasting:** patient-adaptive EEG monitoring and probabilistic forecasting of seizure risk.
- **Wearable monitoring and ECG (Hridae):** wearable devices, ECG models and patient-specific heart models for precision cardiology and neurology.
- **Automated medical image processing:** automated pipelines that prepare and analyse images across medical imaging modalities.
- **Local AI agents:** lightweight agents on an 8 GB laptop GPU for coding, research and document work.
- **Offline cognitive assessment:** browser-based battery across eleven cognitive domains with on-device measures and within-person change tracking.

Selected Projects

GenEEG: patient-adaptive synthetic EEG *IIT (BHU)*

Latent diffusion that generates synthetic seizure EEG, with continual learning one patient at a time. [code]

Hridayam: AI-assisted non-invasive cardiovascular imaging *Smart India Hackathon 2024, Winner*

Multi-sensor, point-of-care cardiovascular screening prototype. [code]

Firefly: VR-guided robotic exosuit for stroke rehabilitation *PRAGATI Hackathon 2023, 2nd runner-up*

VR environment coupled to a robotic exoskeleton. [code]

Motor-imagery BCI for prosthetic control *IIT (BHU)*

Translates motor-imagery EEG into prosthetic arm commands in real time, decoding live on a Raspberry Pi 5.

GemSAM: explainable multimodal image analysis on edge hardware *Kaggle MedGemma Impact Challenge 2026*

Agentic pipeline combining MedGemma and SAM 2. [code]

CogniDhi and HippoSphere AI *Stanford Longevity Design Challenge 2025–26; MIT Media Lab Moodeng AI Challenge*

Cognitive health platform; lightweight computer vision for animal behaviour monitoring. [CogniDhi] [HippoSphere]

Skills

Signals & models	EEG, ECG and PCG processing; qEEG and spectral features; ICA artefact handling; source connectivity; GNNs; latent diffusion; continual and patient-adaptive learning; medical image processing; LLM-based agents
Evaluation	Subject-grouped cross-validation; external-cohort testing; shortcut and confound checks; paired bootstrap and permutation tests; calibration
Engineering	Python, PyTorch, MNE, MATLAB, C/C++, C#, TypeScript, React, GCP; embedded EEG, low-noise PCB design, Raspberry Pi and microcontrollers; Unity VR/XR
Clinical & lab	Clinical study design and ethics applications; clinician review workflows; cell culture, molecular biology, animal studies

Honours & Training

- **Winner**, Smart India Hackathon 2024 (Hardware Edition), Government of India.
- **2nd Runner-up**, PRAGATI Hackathon 2023, iHub Drishti (TIH), IIT Jodhpur.
- **GATE 2023**, Life Sciences, All India Rank 1313.
- g.tec BCI & Neurotechnology Spring School 2025: invasive and non-invasive BCI.
- Neurogati / CNS Lab, IIT Madras: computational brain modelling and brain-inspired AI.
- SERB Karyashala, IIT Roorkee: AI in human brain-computer interaction.
- CSIR-IICB Skill Development Programme: molecular cloning, protein expression and characterisation.

Beyond Science

Independent artist, musician and filmmaker (music, IMDb).
